Bframework Installation
Pictorial view

Let suppose we have a new website and there is nothing in root of website and website url is
http://bframework.buddyexpress.net

Index of /

Name Last modified Size Description

Apache/2.4.3 (Bserver) OpenSSL/1.0.1c PHP/5.4.7 Server at bframework.buddyexpress.net Port 80

Now download Bframework package and extract a package on your website, let suppose we extracted a package at root,
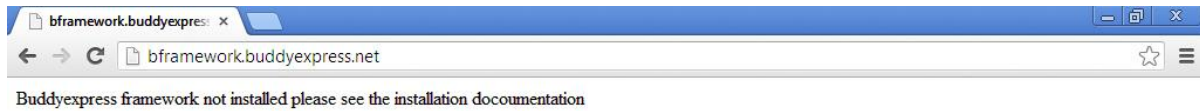

| Name	Last modified	Size	Description
CHANGELOG	2012-11-09 23:35	0

application/	2012-12-16 04:08	-	
bframework/	2012-12-16 04:09	-	

Apache/2.4.3 (Bserver) OpenSSL/1.0.1c PHP/5.4.7 Server at bframework.buddyexpress.net Port 80

After extraction refresh url now you see page saying 'Buddyexpress framework not installed please see the installation docoumentation' similar to this,

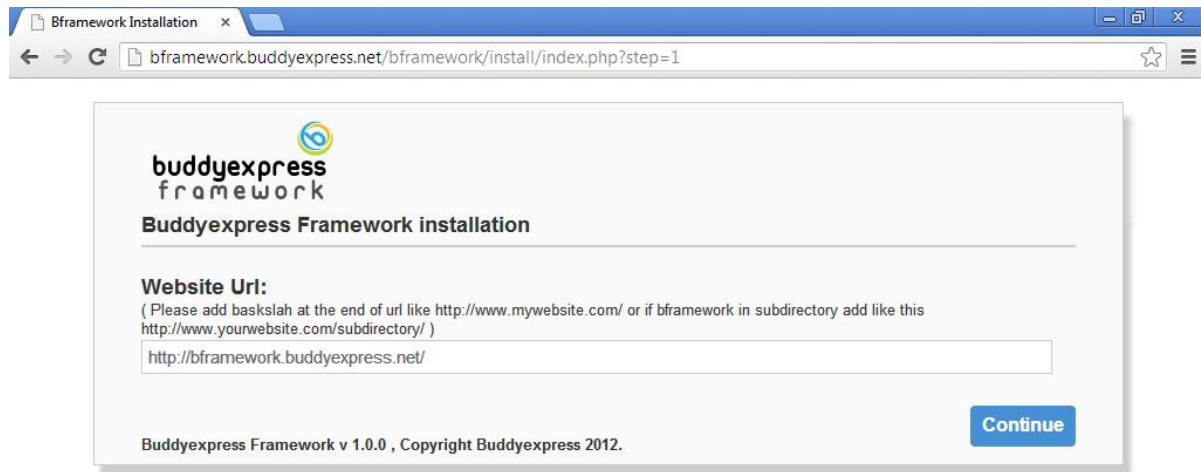

Now you need to install a bframework by visiting this url
http://bframework.buddyexpress.net/bframework/install/index.php
 Where you can change bframework.buddyexpress.net to your website name , you see page similar to this,

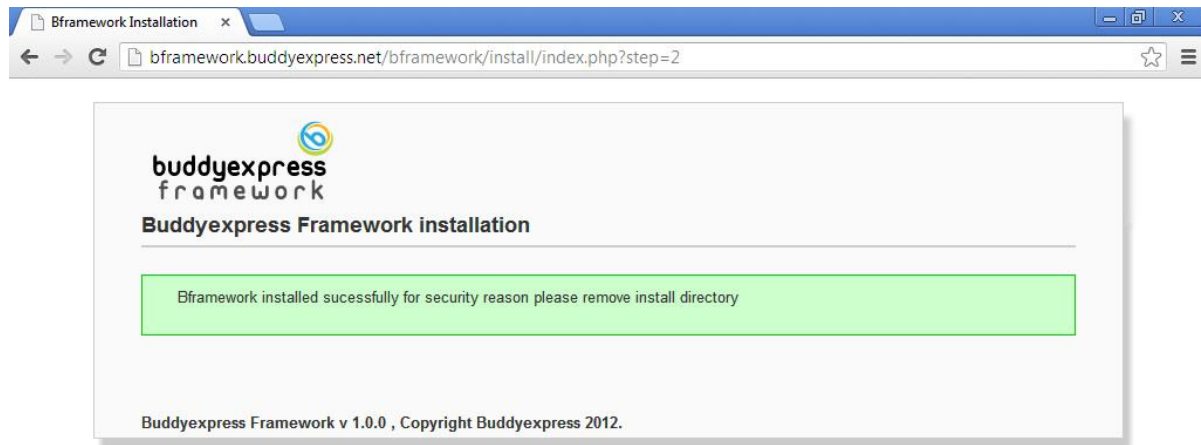

If your server fulfill the requirement then you will see continue button now press continue button ,

You will see page similar to this after clicking continue,

Now enter your website url, if your website in subdirectory then also include subdirectory name with backslah,

According to tutorial our website url is http://bframewrok.buddyexpress.net
So we can enter http://bframewrok.buddyexpress.net and press continue,
After pressing continue you see page similar to this,

Now remove 'install' directory from bframework folder for security reason

If you having problem in installing please visit bframework support group on buddyexpress.net

Thanks
